Exploding Coulomb Clusters and Nuclear Fusion **“Hot Fusion on a Desk Top”**

Prof. Allan Widom
Physics Department
Northeastern University Boston MA, USA

Abstract: Among the methods presently being studied world wide to obtain clean controllable nuclear fusion as a power source, the use of pulsed laser light incident on molecular clusters is considered. Main results will be presented:

- (i) The experimental evidence of fusion events is unambiguous and reproduced in several laboratories.
- (ii) Theoretical Coulomb barrier tunnelling transitions for nuclear fusion are in very good agreement with experimental data.

Seguirà dibattito:

La fusione nucleare non-convenzionale in Italia
